

CS 381 Project 1 documentation

Please include the following as part of your document for project 1.

- Design documentation:

Please describe the overall structure of the project. Describe the choice of data structures and implementation details for the main functions (such as BFS, DLS and IDS). Specifically, show the pseudo-code for all the main functions implemented. Also state any libraries used as appropriate. (Please use only the standard libraries, not developed by third party that requires downloads.)

- Code documentation:

List all the functions you have implemented. For each function, state exactly the inputs and outputs. Also state pre-conditions on the input.

For example, the function Neighbor takes as integer n (board dimension) input a board S (which is a vector of length n^2) and returns as output a list of boards that can be reached from S in one step. Precondition: S is assumed to be a permutation of $\{0, 1, \dots, n^2 - 1\}$.

- Instructions for compiling and running the code.
- A brief description of test effort: This could just be at least four test cases. In each test case, exhibit the output by your program and how you confirmed the correctness of these outputs.
- Make sure to include all the relevant files.
- State clearly the support used by AI. This requires (a) summary of what parts of coding was done using AI and (b) the full transcript of the dialog with AI assistant.
- Role of each person in the team.
